# CDH - Making and Using 

A technical discussion of CDH<br>PM CLO2 at g2cForum.org to contribute to this discussion

## 1. Introduction

A. A new way to make MMS1 (Master Mineral Solution) or CD (Chlorine Dioxide, CLO2), is called CDH which is an acronym for Chlorine Dioxide Holding (Solution).
B. This new MMS1/CD has very little smell or bad taste at low doses and is easier to take.
2. How to make CDH - 1 Bottle Method CDH One Bottle basic recipe: $22+1+1=24$
A. Three ingredients are needed to make CDH : (all at room temperature)

1. DW (Distilled Water, RO ${ }^{1}$ or purified water)
2. SC ( $22.4 \%$ Sodium Chlorite solution from $28 \%$ salts)
$3.4 \% \mathrm{HCL}$ ( $4 \%$ hydrochloric acid) or $35 \%$ citric acid
B. A simple recipe to make One Bottle CDH is:
3. 22 parts water +1 part SC +1 part acid (22+1+1=24) (HCL will taste much better that CA)

4. The basic recipe can be scaled up to fit any bottle.
5. If a Schweppes glass 300 ml bottle with plastic lid is used as -> shown here, the amounts of ingredients could be:
 220 ml water +10 ml SC +10 ml acid added in that order.
6. Another example is 28.5 ml DW $+1.3 \mathrm{ml} \mathrm{SC}+1.3 \mathrm{ml}$ acid to fit in a 30 ml or 1 fluid ounce (US) bottle also shown above.
7. After adding the three room temperature ingredients, quickly put the cap on so the CLO2 gas will not escape. The cap must be leak-proof. Shake bottle to mix well.
8. Put the bottle of solution in a dark, room temperature place for 12 or more hours. If room temperature is below about $70^{\circ} \mathrm{F}\left(21^{\circ} \mathrm{C}\right)$ then increase the time up to 24 hr .
9. Tip: Reducing the air space above the solution in the bottle will make stronger $C D H$. Just remember to keep the recipe ingredient ratio the same $22+1+1$.
10. If refrigeration is available after the $12+$ hour room temperature activation period, put the unopened bottle in a fridge to cool it down. When CDH is below about $51^{\circ} \mathrm{F}$ $\left(10^{\circ} \mathrm{C}\right)$ there will be less CLO2 gas escaping when the bottle is opened. After taking out a dose of CDH , quickly recap the bottle and put it back in the fridge. Also, keep CDH away from sunlight. Even diffused sunlight will cause CLO2 gas to escape.
11. How to make CDH - 2 Bottle Method

CDH Two Bottle basic recipe: $2+1+1=4+20=24$
A. Three ingredients are needed to make CDH: (all at room temperature)

1. DW (Distilled Water, RO (Reverse Osmosis) or purified water)
2. SC (22.4\% Sodium Chlorite solution from $28 \%$ salts)
3. $4 \% \mathrm{HCL}$ ( $4 \%$ hydrochloric acid) or $35 \%$ citric acid
B. A simple recipe to make Two Bottle CDH is:
4. Two parts $D W+1$ part $S C+1$ part acid added in that order. $(2+1+1=4)$
5. This solution will later be diluted with more DW using another simple formula:
6. Add five times as much DW as the total parts of the first solution.
7. The first solution totals 4 parts, so 5 times those 4 parts is 20 parts added DW.
8. Ex: 20 ml DW $+10 \mathrm{ml} \mathrm{SC}+10 \mathrm{ml}$ acid +200 ml DW added later $=240 \mathrm{ml}$ CDH.
C. Making CDH - An example
9. Choose a bottle you want to use. It can be almost any bottle that will seal well.
10. Glass may be the best choice, but plastic can also be used.
11. A non-metallic lid must be used and it must make a tight seal to the bottle.
12. Most of the space in the bottle should be liquid with little air space at the top.
13. A 150 ml small Franks Hot Sauce bottle with 10 ml for air, leaves 140 ml for CDH .
14. $70 \mathrm{ml} \mathrm{DW}+35 \mathrm{ml} \mathrm{SC}+35 \mathrm{ml}$ acid $=140 \mathrm{ml} .(2+1+1$ scales up $35 x$ to $70+35+35)$
15. Add 70 ml DW to the 150 ml bottle. Add 35 ml SC to the 140 ml DW. And last, add 35 ml acid \& cap. Be sure to add the acid last or you may have a violent solution reaction. Shake to mix well. Keep the bottle out of sunlight.
16. A reaction should begin almost immediately with the solution turning a dark orange color. About 10 minutes later it should be a dark red color. When the color no longer gets darker, put the bottle in a fridge. Note that the activation is done at room temperature. Ingredients must also be at room temp.
17. If you made 140 ml of $\mathrm{CDH}(70+35+35)$ then put 700 ml of distilled water in another bottle and into the fridge to cool down along with the 140 ml of $\mathrm{CDH} .140 \mathrm{ml} \times 5=700 \mathrm{ml}$. Use a 1 liter bottle, glass preferred with a tight fitting plastic cap.

18. About two hours after the two bottles have been in the fridge, take them out and combine both cold solutions into one bottle. That combined solution will total 840 ml of diluted CDH. The 840 ml of CDH can be stored in smaller glass bottles such as two 500 ml glass bottles with tight fitting plastic caps or synthetic corks. Real cork will be destroyed by the CLO2 gas. Best to keep CDH in the fridge \& only take it out to remove CDH for dosing.

## 4. How to use CDH - 1 or 2 Bottle Methods

A. The 840 ml of diluted CDH contains about 3000 mg ( 3 g ) of $\mathrm{ClO2}$ (Chlorine Dioxide).
B. Dosing is a personally determined amount, but a starting dose can be recommended.
C. If a person is very sick and/or very toxic, starting with low amounts and increasing slowly is desirable. You could start with 1 ml and increase until a Herxheimer occurs.
D. One milliliter ( 1 ml ) of the stock CDH solution ( 840 ml in the example above) contains about 3.6 mg of $\mathrm{ClO2}$. Take 1 ml or more of CDH in a glass of water for each hourly dose.
E. If that amount of ClO 2 causes a Herxheimer reaction, then use less than 1 ml of the CDH diluted solution for hourly doses. Increase the dose slowly from a non-Herxheimer reaction dose until the person Herxs again, the reduce to non-Herx dose. Continue increasing until the person can go no higher.
F. Since ClO 2 only stays in the body about 1.5 hours, dosing consecutive hours will be most effective. The more hours per day the better. Increase the hourly dose until a Herxheimer reaction occurs, then reduce slightly. The more hours per day and the higher the dose, the quicker the ailment(s) may be remedied. Using an 8 fluid ounce glass baby bottle \& dosing 1 fluid ounce per hour is an easy way to dose daily. Add 8 ml CDH \& fill bottle to the 8 fluid ounce mark with distilled water for 3.6 mg doses per hour per fl oz. You would be dosing 1 ml CDH hourly when 8 ml is added to the baby bottle. Increase the milliliters of CDH added to the baby bottle as needed.
G. SweetLeaf brand Stevia drops added at 1 drop per ml of CDH will improve the taste.
H. The question of when to eat, when to take MMS2, supplements, herbs, etc., perhaps can be answered by referring to the following schedule. Modify to suit your needs.

| Time | MMS1/CDS/CDH | MMS2 | Eat |
| :---: | :---: | :---: | :---: |
| 0800 | x |  |  |
| 0830 |  |  | x |
| 0900 | x |  |  |
| 0930 |  | x |  |
| 1000 | x |  |  |
| 1030 |  |  | x |
| 1100 | x |  |  |
| 1130 | x | x |  |
| 1200 | x |  |  |
| 1230 | x | x |  |
| 1300 |  |  |  |
| 1330 | x | x |  |
| 1400 |  |  | x |
| 1430 |  |  | x |
| 1500 |  |  |  |
| 1530 |  |  |  |
| 1600 |  |  |  |
| 1630 |  |  |  |
| 1700 |  |  |  |
| 1730 |  |  |  |
| 1800 |  |  |  |
| 1900 |  |  |  |

Eat \& take antioxidants after 1900

## 5. How to make CDH - Capsule Method \#1

See page 8 for How to make CDH - Capsule Method \#2
A. Two ingredients are needed to make CDH capsules:

1. SC (22.4\% Sodium Chlorite solution from $28 \%$ salts)
2. $4 \% \mathrm{HCL}$ ( $4 \%$ hydrochloric acid) or $35 \%$ citric acid
B. A simple formula to make CDH is:
3. Combine equal parts SC and acid
C. Making CDH Capsules - An example NOTE: DISCARD THIS RECIPE AFTER ONE DAY.
4. In a 30 ml ( 1 fl oz US ) glass or plastic bottle put 15 ml of SC
5. Add 15 ml of acid and immediately cap the bottle. (leak-proof non-metallic cap)
6. Be sure to add the acid to the SC, not the reverse order.
7. When the solution color no longer gets any darker, put the bottle in a fridge.
8. Also keep an eye dropper in the fridge so it stays cold.
9. An HDPE plastic bottle with a dropper top could be used so no eye dropper needed.
10. How to use CDH - Capsule Method \#1
A. Using your favorite size capsule, dispense drops into the capsule and assemble.
B. The 30 ml CDH capsule solution contains about 1200 mg ClO2. (Test \#71)
C. 30 ml of solution contains about 720 drops. ( 24 drops of solution $=1 \mathrm{ml}$ )
D. Therefore each drop of the 30 ml of CDH contains about 1.7 mg ClO .
E. Can also be used topically by applying with a Q-tip.
11. Example calculation for the amount of $C L O 2$ in 31 ml of $C D H$ made in the 1 fl oz bottle. (See section 2.B. 4 above)
A. "The maximal theoretical yield is $160 \mathrm{mg} / \mathrm{m} / \mathrm{SC}$ solution ( $22.4 \% \mathrm{w} / \mathrm{w}$ ). or 6.7 mg per 1 drop SC ( 24 drops $/ \mathrm{m} /$ ). These values may vary slightly with SC concentration." (TH)

- 28.5 ml DW $+1.3 \mathrm{ml} \mathrm{SC}+1.3 \mathrm{ml} 4 \% \mathrm{HCL}=31.1 \mathrm{ml}$ solution
- 4500ppm CLO2 measured in 31 ml of CDH and 1.3 ml of SC was used.
- Using the formula:
- Volume (liters) $\times$ Concentration (ppm) $=$ Dose (mg)
- 0.031L $\times 4500 \mathrm{ppm}=139.5 \mathrm{mg}$ CLO2
- $139.5 \mathrm{mg} / 31 \mathrm{ml}=4.5 \mathrm{mg}$ CLO2 per 1 ml of $C D H, 0.19 \mathrm{mg} /$ drop $C D H$
- $139.5 \mathrm{mg} / 1.3 \mathrm{ml}$ SC $=107 \mathrm{mg}$ CLO2 $/ \mathrm{ml}, 4.5 \mathrm{mg} /$ drop of SC used.
- Not bad compared to the maximum theoretical yield of 6.7 mg per drop of SC.
- $5.0 \mathrm{mg} / \mathrm{drop}$ SC has been achieved using the CDH Two Bottle method. (Test \#59)
- Each drop of 746 drops CDH contains 0.19 mg of CLO2. ( 24 drops $=1 \mathrm{ml}$ solution)

Sodium Chlorite chemical formula $=\mathrm{NaCLO} 2$
No maximum daily dose has been determined. ${ }^{1}$ RO = Reverse Osmosis water

## 8. Orally Dosing MMS1, CDS \& CDH

A. Reading how others ingest CLO2 and the reasons why there are different methods used, I have changed my way of dosing CLO2.
B. G2C Forum member gefeu2 (Gerhard) suggests administering CLO2 perlingually by absorption through the oral mucosa and tongue \& cheek interior surfaces. He also recommends administering CLO2 sublingually under the tongue and sublingual glands. Both methods occur when one holds a mouthful of either of the three varieties of MMS a minute or so before swallowing. Could be called the Mouth Holding Method.
C. After holding the CLO2 solution in one's mouth for a minute or two, swallowing will then allow the solution to travel down to the stomach where further CLO2 absorption may take place. I have noticed less throat irritation when using this method as some of the CLO2 is used up in one's mouth before traveling downward through the throat.
D. However, if there is food in one's stomach, the CLO2 probably won't be so effective as when the stomach is empty.
E. So, it seems to me that the most effective way to orally ingest CLO2 is by using both methods: perlingually-sublingual in the mouth (MHM) \& with an empty stomach.
F. Eating becomes a concern while ingesting CLO2 if one wants the highest effect. Ingesting the first dose of the day is easy because one's stomach should be empty after arising from sleep. So, just lightly snacking on the half hour for the following doses if you are hungry and eating a large evening meal, may be one answer to that eating question.
G. I notice my digestion seems better after taking my morning 20mg CLO2 CDH dose, so maybe the unused HCL is helping my stomach breakdown food?

## 9. Making CDH using kitchen measuring utensils

A. Using only a kitchen measuring cup (US) and a teaspoon, I made CDH using the One Bottle Method. The only other item needed was a Schweppes 10 fl oz ( 300 ml ) glass bottle and its tight sealing cap.
B. One cup of water was put in the bottle followed by two teaspoons each of SC and $4 \% \mathrm{HCL}$. After 12 hours at $72^{\circ} \mathrm{F}$ the 260 ml CDH measured $3300 \mathrm{ppm}, 858 \mathrm{mg}$ CLO2, $86 \mathrm{mg} / \mathrm{ml}$ ( $3.6 \mathrm{mg} / \mathrm{drop}$ ) of SC used. This CDH contains $3.3 \mathrm{mg} / \mathrm{ml}$ ( $0.14 \mathrm{mg} / \mathrm{drop}$ ) CLO2. The few seconds the chemicals were in contact with the stainless steel teaspoon would not be enough time to oxidize the metal.

## 10. SC vs MMS

A. MMS, CDS and CDH are made from the same two chemicals:

1. SC ( $22.4 \%$ Sodium Chlorite solution from $28 \%$ salts), consisting of $80 \%$ sodium chlorite and distilled water, and
2. An acid, ideally 4\% HCL for MMS and CDH and $10 \%$ HCL for CDS.
B. MMS, CDS and CDH are the acronyms for these three oxidizers:
3. MMS $=$ Master Mineral Solution
4. CDS = Chlorine Dioxide Solution
5. $\mathrm{CDH}=$ Chlorine Dioxide Holding (Solution)
C. However, from the beginning the acronym MMS has also been used to describe SC, (22.4\% Sodium Chlorite solution from $28 \%$ salts). This causes great confusion to this day.
D. To differentiate between the two MMSs, sometimes you will read or hear the terms unactivated MMS and activated MMS. Also found are MMSU and MMSA. Unfortunately, you will read \& hear just MMS \& that can refer to either of the two definitions for MMS.
E. Therefore, I propose that the acronym MMS be used only to describe the finished product, Master Mineral Solution, and SC to denote one of two ingredients in MMS, 22.4\% Sodium Chlorite solution from $28 \%$ salts; the second ingredient being an acid activator.
F. Some have used the acronym CD (Chlorine Dioxide) to describe MMS, but that is incomplete as we know there is more than chlorine dioxide (CLO2) in MMS. CD would be an accurate description for CDS, however, as CDS only contains chlorine dioxide gas in a distilled water solution.
g. UPDATE: G2C definitions: MMS $=(22.4 \%$ Sodium Chlorite solution from $28 \%$ salts) MMS1=activated MMS.

## 11. Killing the Malaria Parasite with MMS, CDS \& CDH

According to Tomas Horky, a chemist who is a Genesis 2 Church Forum member, 6.7 mg of CLO2 is the maximum possible amount of CLO2 that can be extracted from 1 drop of $22.4 \%$ SC solution (unactivated MMS). So, that means when 18 drop MMS doses were used to cure malaria in the past, the maximum possible amount of CLO2 that could be produced externally plus internally from those 18 drops of SC would have been 121 mg of CLO2.
If CDS was used, 40 ml of 3000 ppm CDS would be needed. ( $03 \mathrm{mg} / \mathrm{ml}=121 / 3=40$ )
If CDH was used, 18 ml of CDH would be needed. ( 1 ml CDH $=1$ drop MMS)
( 1 or 2 bottle method)
One way to help a malaria patient ingest these large amounts of $C D S$ or $C D H$ would be to add the doses to a 500 ml bottle of bottled water after removing enough water to allow the CDS/CDH to fit. Then have them drink the whole bottle over a short period of time.

## CDH - Going Beyond CD \& CDS

## 12. The CDH Formulation Table and Different Acid Concentrations

What if you have $10 \%$ Hydrochloric acid or 50\% Citric Acid (very common) Or, you wish to use a different size of bottle? Not a problem. These acids can still be used. However, the formula changes accordingly.

The table below is a great tool for determining the formula for a given bottle size. To use the table, start by circling the size of the bottle you wish to fill in the left most column. Next look at the acid you have and its labeled concentration. Match that with one of the 4 options across the top. Below the matching acid/concentration you will find the 3 formulation numbers for water, sodium chlorite (labeled "SC"), and whatever acid you are using. Just go down the appropriate 3 columns to where the bottle size line intersects and you will have the numbers you need. Substitute these numbers in the following preparation instructions if your situation calls for it.

## CDH Formulation Table - Units are Milliliters (ml)

(Applies to the One Bottle Method of making CDH ONLY!)
SC=Sodium Chlorite / HCl=Hydrochloric Acid / CA=Citric Acid (Thanks to Kerri Rivera for allowing this page from her book to be reproduced here)
Healing The Symptoms Known As Autism by Kerri Rivera (Page 161) (Second edition) http://mmsautism.org/bookstore

| Water <br> Bottle | Hydrochloric Acid 4\% |  | Hydrochloric Acid $10 \%$ |  | Citric Acid 35\% |  |  | Citric Acid 50\% |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |

## 13. How to make CDH - Capsule Method \#2

This method is a modified CDH Two Bottle Method for use in capsules. See test \#73. CDH was made in a $1 \mathrm{fl} \mathrm{oz} \mathrm{(32ml)} \mathrm{glass} \mathrm{bottle} \mathrm{with} \mathrm{a} \mathrm{Polyseal/Polycone} \mathrm{cap} \mathrm{so} \mathrm{there} \mathrm{was} \mathrm{no}$ gas leakage.
$20 \mathrm{ml} \mathrm{DW}+5 \mathrm{ml} \mathrm{SC}+5 \mathrm{ml} 4 \% \mathrm{HCL}=30 \mathrm{ml}$ total $+\sim 2 \mathrm{ml}$ DW to completely fill the bottle.
Activation time was 15 minutes, then 1 hour in the fridge before opening the bottle.
As you can see, I did not add 5 times 32 ml additional water after the activation period as CDH Two Bottle Method calls for. I left out the additional 160 ml of water. So, we have a much stronger CDH solution in just 32 ml . Compared to mixing SC and 4 HCL only, there was no heating felt on the bottle and just a hint of gas releasing when the cold bottle was first opened. The color started out a light orange and progressed to medium orange. At 9 days, slightly less orange color noted compared to a new batch made on day 9.

This CDH produced 0.57 mg CLO2/drop $(13.7 \mathrm{mg} / \mathrm{ml}$ ) of the 32 ml CDH. If you can fit 15 "drops" in a capsule, that would give you 8.6 mg of CLO2 per capsule. A second measurement made on day 8 showed about the same as the original. Tested $6 \%$ higher. This recipe seems stable for at least a week which should be enough time to use up the contents of the bottle. My activation time tests some time ago for a MMS 3 drop 4 HCL 60 second open container activated dose, showed about 2.6 mg CLO2. Who knows how much more CLO2 might be generated after a MMS 3 drop 60 second activated dose is ingested. If twice, then a 3 drop dose might produce 5.2 mg CLO2. Btw, veggie-caps survive almost twice as long as gel-caps. If that is true, then about 0.38 ml ( 9 drops) of this CDH might be equal to a 3 drop MMS 4 HCL 60 second activated dose. 0.38 ml can easily be measured using a 1 ml syringe.

Using a 1 teaspoon measuring spoon you can make capsule CDH this way:
Add 4 tsp DW to a $1 \mathrm{fl} \mathrm{oz}(30 \mathrm{ml})$ glass bottle Add 1 tsp SC
Add 1 tsp 4HCL
Fill to top with more DW
That would be $20 \mathrm{ml}+5 \mathrm{ml}+5 \mathrm{ml}=30 \mathrm{ml}+$ additional $\sim 2 \mathrm{ml}$ of DW to fill this bottle bottle as full as you can to keep the air space to a minimum. Past testing has shown a $25 \%$ increase in CLO2 when the bottle is full compared to half full. I think we are forcing the CLO2 into solution rather than let it outgas and escape when the bottle is opened. This recipe CAN BE USED WITHOUT CAPSULES, TOO.

Activate about 10-15 minutes. Put the bottle in a fridge
 for an hour or so. DMSO can be added: 1 drop DMSO per 6 drops of this CDH recipe.

## 14. Activating CDH in open \& closed topped containers CDH Capsule recipe \#2: 4+1+1=6

Three tests were preformed to determine if there is a difference in CLO2 concentration when activating CDH Two Bottle Method in open topped and closed containers. Activation time 15 minutes at 72 F room temperature with $3 \times 5$ second agitations @ 0,5,10 minutes. All bottles were capped at the end of the 15 minute activation period and put in a fridge to cool down before measurements were taken.

22 ml DW +5 ml SC +5 ml 4 HCL

1. 1 fl oz capped small mouth bottle $=13,300 \mathrm{ppm}$
2. 1 fl oz uncapped small mouth bottle $=13,700 \mathrm{ppm}$
3. 1 fl oz open topped shot glass $=12,100 \mathrm{ppm}$

\#1 \& 2 were essentially the same, which was a surprise. \#3 was only $12 \%$ less ppm with a mouth area of $16 \times$ larger than the bottles.

## 15. Daily CDH Doses by Body Weight

The following CDH daily dosing recommendations were developed for Kerri Rivera to be used by autistic children following her autism recovery protocol. Anyone can use the chart.

Estimated Full Oral CDH Doses by Weight per Day
Use these numbers as a guide only. You may need to go up by as much as $25 \%$ or more over the indicated milliliters. Read chart as: POUNDS / KILOGRAMS $\rightarrow$ MILLILITERS OF CDH
